1186 GAGCGCCAGGAGGCAGGCCAAGCGGCAGCTGGAGCAGAAGCAGCTGGAGAAGCAG 1245 anchoring region for transmembrane or membrane-anchoring regions that are anchoring region for transmembrane or membrane-anchoring regions that are not naturally part of the protein. The relative response of membrane-associated proteins to cell surface-associated antigen versus antigen in solution, and the sensitivity of intracellular signaling mediated by membrane-associated proteins can be altered. They can be important in treatment of e.g. HIV infection, bacterial infections, parasitic infections, inflammatory/autoimmune disorders (e.g. rheumatoid arthritis, osteoarthritis or inflammatory bowel disease), cancer, allergic/atopic diseases (e.g. asthma or eczema), congenital disorders (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. cystic fibrosis), neurological disorders (e.g. multiple sclerosis), organ psoriasis), neurological disorders (e.g. multiple sclerosis), organ transplant rejection, graft-versus-host diseases, or metabolic/idiopathic diseases (e.g. diabetes) The present sequence was used in the construction of chimeric receptors. The properties and level of expression of a membrane-associated protein may be altered by substituting a transmembrane region or a membrane-Altering the properties or level of expression of membrane-associated proteins, e.g., to change responses to cell surface antigens or the sensitivity of intracellular signaling. Detecting alterations in trinucleotide repeat (TNR) tract lengths in

Miret JJ;

Lahue RS, Pelletier R,

WPI; 2002-575460/61

```
The invention relates to detecting (MI) alterations in trinucleotide repeat (TMR) tract lengths comprising: (i) contacting mammalian cells with a shuttle vector (containing approximately 25 repeats) that enters and replicates in the cells, (ii) recovering the replicated shuttle vector from the cells, (ii) introducing the vector into a yeast cell in the presence of a selection agent or (where the expanded TMR confers a Hist-phenotype) in the absence of histidine, alteration to the TMR tract confers resistance to the selective agent or Hist-phenotype; and (iv) selecting yeast cells with the shuttle vector containing TMR tract confers resistance to the selective agent or Hist-phenotype; and (iv) selecting yeast cells with the shuttle vector containing TMR tract confers resistance to the selective agent. Also included is an adaptation of the vest cells in the absence of uracil. The methods of the present invention are useful for identifying disorders with genetic alterations associated with TMR instability such as cancer (e.g. testicular and prostate), Fragile x syndrome, Huntington's disease, myotonic dystrophy, spinal and bulbar muscular atrophy (SBMA), priedreich's ataxia and kennedy's disease. The present sequence is the CAG32 TMR known to be unstable in Human sperm and in yeast which was tested in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1192 CAGGAGCAGGAGGCCAAGCGGCAGCTGGAGCTGGAGAAGCAGCTGGAGAAGCAGCGGGAG 1251

The properties and level of expression of a membrane-associated protein may be altered by substituting a transmembrane region or a membrane and notaring region for transmembrane or membrane-anchoring regions that are not naturally part of the protein. The relative response of membrane sasociated proteins to cell surface-associated antigen versus antigen in colution, and the sensitivity of intracellular signaling mediated by solution, and the sensitivity of intracellular signaling mediated by conting the cell surface-associated proteins can be altered. They can be important in treatment of, e.g. HIV infection, bacterial infections, parasitic infections, inflammatory/autoimmune disorders (e.g. rheumatoid arthritis, osteoarthritis or inflammatory bowel disease), cancer, allergic/atopic diseases (e.g. asthma or eczema), congenital disorders (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. metabolic/idiopathic riseases (e.g. diseases (e.g. metabolic/idiopathic diseases (e.g. diseases (e.g. diseases (e.g. diseases (e.g. metabolic/idiopathic diseases (e.g. diseases (e.g. metabolic/idiopathic diseases (e.g.

The properties and level of expression of a membrane-associated protein may be altered by substituting a transmembrane region or a membrane-anchoring region for transmembrane or membrane-anchoring region for transmembrane or membrane-associated proteins to cell surface-associated antigen versus antigen in solution, and the sensitivity of intracellular signaling mediated by membrane-associated proteins can be altered. They can be important in treatment of, e.g. HIV infection, bacterial infections, parasitic infections, inflammatory/autoimmune disorders (e.g. rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          infections, inflammatory/autoimmune disorders (e.g. rheumatoid arthritis, obsteoarthritis or inflammatory bowel disease), cancer, allergic/atopic diseases (e.g. asthma or eczema), congenital disorders (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. cystic transplant rejection, graft-versus-host diseases), ocusion, graft-versus-host diseases, or metabolic/idiopathic diseases (e.g. diabetes)
                                                                                                                                                                                                                                          present sequence was used in the construction of chimeric receptors.
                                                                         Altering the properties or level of expression of membrane-associate proteins, e.g., to change responses to cell surface antigens or the sensitivity of intracellular signaling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 94 BP; 32 A; 25 C; 35 G; 2 T; 0 U; 0 Other;

The invention describes a method of determining open reading frames in the genome of organism, comprising contacting mRNA from cell of organism with a single oligonucleotide primer (I) at low stringency, preparing single-stranded coDNA by reverse transcribing mRNA with (I), amplifying single-stranded cDNA by reverse transcribing mRNA with (I), amplifying single-stranded cDNA by reverse transcribing mRNA with (I), amplifying connected by the method is useful for: determining that a known manier connected sequence from a genome of an organism corresponds to a nucleotide sequence from a genome of an organism corresponds to a nucleotide sequence from a genome of an organism corresponds to a long connect of an open reading frame; for preparing a contig, mucleic acid molecule from a genome of an organism. mRNA is obtained from mammalian corresponds to a subject and can be used to carry out genetic analyses of all or part of subjects and can be used to carry out genetic analyses of large or small populations. further, it can be used to study living systems to determine if, e.g. there have been genetic shifts which render an individual or population more or less likely to be afflicted with diseases such as cancer, to determine antibiotic resistance or non-tolerance, and so forth. The method can also be used to offspring through ova or sperm. The analyses for pathological conditions can be trucied out in all animals, plants, birds, fish, etc. Using this method, in the area of agriculture, for example the genomes of food crops can be cut in the area of agriculture, for example the genomes of food crops can be cut and so be studied in this way. Similarly, the method permits determination of the pathogens which integrate into the genome, such as retroviruses and other integrating viruses such as influence are processed the method is also applied to eukaryotic pathogenes. The method is also applied to eukaryotic pathogenes with a such connected to the entail of the ent

    by PCR and determining number

                                                                                                                                                                                                                                                                                                                                                              This sequence represents a fragment of the SCA2 gene. It can be used in the method of the invention for diagnosing spinocerebellar ataxis type II. by performing PCR on the test DNA using two primers hybridising to parts of the SCA2 gene sequence, and determining the number of CAG repeats in the amplified products. The method provides an easy means for the diagnosis of spinocerebellar ataxis type II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SCA2 gene; spinocerebellar ataxis type II; CAG repeat; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a fragment of a human CAG repeat containing clone DNA sequence isolated using the method of the invention. The method is for analysing nucleic acids in a sample, and comprises: (a) providing a sample containing nucleic acid, a first oligonucleotide primer comprising a CTG repeat, a second oligonucleotide primer comprising a CAG repeat and a polymerase and PCR reagents; (b) preparing the nucleic acid so that it is amplifiable; (c) amplifying the nucleic acid with the first and second primers; and (d) detecting the amplified product. The method is used to distinguish between the expression of genes in two or more blological samples, e.g. body fluids, cells, solid tissue or solid and differentiate between normal and diseased tissue or to assess the variation within monozygonic twin pairs. The method allows the isolation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and analysis of genome subsets containing CAG repeats which are known to be important in a number of neurological diseases including Huntington's chorea. The method uses PCR suppression, in which only fragments which contain a target repeat are efficiently amplified. This allows accurate identification of differentially expressed genes in various cell types. Genome complexity is reduced by the new method which targets genomic subsets containing CAG repeats
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Analysing nucleic acid samples - using amplification primers which contain CAG or CTG tri:nucleotide repeats for differential display of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to a mucleic acid hybridisation probe comprising a labelled, single copy nucleic acids of at least 50 nucleotides, which will hybridise to a deduced single copy sequence interval in target nucleic acid (TNA) of known sequence. The single copy sequence is deduced by comparing the target nucleic acid (e.g. a disease causing gene) with a collection of high and low complexity repeat sequences as found in the genome of the organism from containing the target nucleic acid. The probe is generated by PCR on the target sequence. The probe is essentially free of blocking nucleic acid sequences which will hybridise to repeat sequences within the genome of which the TNA is a part, and is labelled with a label selected from fluorochrome-responsive labels, fluorochromes, calorimetric chemical, conjugated proteins, antibodies, antigens and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       historical cycle regulation defective, S. cerevisiae homologue A; HIRA; low complexity repeat; in situ hybridisation; Southern bloc; chromosome breakpoint; inherited genetic disease; neoplastic disorder; chromosome 22; Di
This sequence represents a fragment of the SCA2 gene. It can be used in the method of the invention for diagnosing spinocerebellar ataxis type II, by performing PCR on the test DNA using two primers hybridising to parts of the SCA2 gene sequence, and determining the number of CAG repeats in the amplified products. The method provides an easy means for the diagnosis of spinocerebellar ataxis type II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

their mixtures. The probe is useful in a hybridisation method, where the hybridisation method is from in situ hybridisation, Southern blot, and cord conter methods in which nucleic acid is immobilised, where the method further comprises selecting a single copy nucleic acid which will content acid which will a further comprises selecting a single copy nucleic acid which will content and person or triplicon sequence domain. The probe is useful for families in a genome. The method comprises reacting a labelled probe with the genome, causing the probe to hybridise and ascertaining if the probe hybridises to the genome at more than three preferably ten different contermining as a determination of new repeat sequence family, where the determining actomosome breakpoint and is useful in the fields for determining a chromosome breakpoint and is useful in the fields for determining a chromosome breakpoint and is useful in the fields for cytogenetics and molecular genetics for determining the presence of specific nucleic acid sequences in a sample of eukaryotic origin, e.g. the probe may be used to analyse specific chromosomal locations by in situ hybridisation as a detection of acquired or inherited genetic diseases especially for detection of acquired or inherited genetic comprising the human HIRA gene (histone cell cycle regulation defective, comprising the human HIRA gene (histone cell cycle regulation defective, comprising the human HIRA gene (histone cell cycle regulation defective, comprising the human HIRA gene (histone cell cycle regulation defective, comprising the probes of the invention. HIRA is located on threated form and within the human genome used to analyse the HIRA gene for repeat found within the human genome used to analyse the HIRA gene for repeat found within the human genome used to analyse the HIRA gene for repeat regions. Note: The sequence data for this patent did not form parting of the printed specification, but was obtained in electronic promparation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or the printed specification, but was obtained in electronic format directly from USPTO at seqdata uspto gov/sequence.html?DocID=20030224356.

0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Contact: Robert B.                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                         y
                                          (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMAP12 (gil 4732114|gb|AR12972.1); a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xiii0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 (bases 1 to 86)

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch oritice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi |4732114|gb|AP129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rm. 308, Biomedical Polymers Research Bldg., 20 S. 2030 B., SLC, UT 84112, USA

The DNA was hydrodynamically sheared by repeated passage through a 0.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWN42 (gi|472114)[a] a copy-number inducible derivative of plasmid R1. The vector was ligated

TITLE

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli Xi10-Gold (Stratagene) cells and selected for ampicillin resistance."

electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114] pA PAT290721.), a copy-number of pMD42 (gi|4732114] pD | APT290721.), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and ppurified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli X11.0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AZ614077 91 bp DNA linear GSS 13-DEC-2000 1M0442B14R Mouse 10kb plasmid UUGCIM library Mus musculus genomic clone UUGCIM0442B14 R, genomic survey sequence.

was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified mad size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-GGld (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /wollinger="genomic DNA"

'RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and Bill, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RescueMu. RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for

Sequence 12, Application US/09043303

Patent No. 6251589

GENERAL INFORMATION:
APPLICANT: SANPEI, Kazujiro
TITLE OF INVENTION: Method for Diagnosing Spinocerebellar Alaxia Type 2 and
TITLE OF INVENTION: Primers Therefor
TITLE OF INVENTION: Primers Therefor
FILE REFERENCE: 0760-0241P
CURRENT APPLICATION NUMBER: US/09/043,303
CURRENT PILING DATE: 1998-05-18
EARLIER APPLICATION NUMBER: PCT/JP96/01999
MUMBER OF SEQ ID NOS: 17
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 12
LENGTH: 78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1251
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

LENGTH: 93
```

```
Sequence 462, Application US/10786970A

Publication No. US20050064449A1

GENERAL INFORMATION:

APPLICANT: JOAN, KNOLL

APPLICANT: ROGAN, PETER

TITLE OF INVENTION: SINGLE COPY GENOMIC HYBRIDIZATION PROBES AND METHOD OF GENERATING CURRENT APPLICATION NUMBER: US/10/786,970A

CURRENT FILING DATE: 2004-02-24

PRIOR PAPLICATION NUMBER: US/99/573,080

PRIOR FILING DATE: 2000-05-16

NUMBER OF SEQ ID NOS: 479

SEQ ID NO 462

LENGTH: 69

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBB3999), a sequence having 65% sequence identity to (SI), (SI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family Small GTPasses as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a single exon probe useful in examples of the printine, but is brand or surveying spart of the printed to be a producing the proteins of the printed to be a produced the protein or but is brand or surveying spart of the printed to be a produced to be a produced the present sequence did not form part of the printed to be a produced to a

comprising several chimeric molecules, where each chimeric molecule has a self-coalescing element (SCE) which is fued, linked or associated with a molecule of interest, and where each SCE is capable of causing individual chimeric molecules to coalesce with other chimeric molecules into higher order aggregates under conditions favourable to aggregation. The aggregate is useful for treating or preventing a disease or condition in patient and has a range of applications including therapeutic, prophylactic and chemical processes. The aggregate comprises a therapeutic polypeptide such as granulocyte-macrophage colony-stimulating factor (GM-CSF), useful for treating haematopoietic conditions such as myelosuppressive disorders e.g. AIDS, infectious diseases, autoimmune diseases, allergies, viral, bacterial and parasitic infections and cancers such as melanoma, leukaemia and lymphoma. This sequence represents DNA encoding an SCE peptide of the invention. The invention relates to an isolated or purified higher order aggregate

comprising a nucleic acid of the invention. The cotton ESTs are useful as molecular tags to isolate genes, to map and to determine gene to isolate genes, to map genes, to determine gene function and to determining whether genes are members of a particular gene family. The nucleic acid molecules may be used for isolating a variety of agronomically significant genes are associated with plant growth, quality, yield, and could also serve as links in metabolic and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to militate stresses encountered during seed germination. The ESTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express agronomically significant genes in these tissues and/or other tissues, and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically significant genes in these tissues and/or other tissues, and also permits the acquisition of molecules are further useful for detecting the presence or quantity of a protein or mRNA and for detecting the presence or quantity of a protein or mRNA and for detecting the presence as specifically claimed EST isolated from a cotton variety Nucotton338 gynoecium tissue cDNA library (LIB3829). New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular tags to map genes.

Claim 1; SEQ ID NO 15848; 34pp; English.

molecular tage to isolate genetic regions, to isolate genes, to map genes, to determine gene function and to determining whether genes are members of a particular gene family. The nucleic acid molecules may be used for isolating a variety of againty. The nucleic acid molecules may be used for isolating a variety of againty, yield, and could also serve as links in metabolic and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to mitigate stresses encountered during seed germination. The BSTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express agronomically significant genes in these tissues and/or other tissues, and also permits the acquisition of molecular mapping, and in cloning of agronomically significant genes. The nucleic acid molecules are further useful for significant genes. The nucleic acid molecules are further useful for significant genes. The nucleic acid molecules are further useful for significant genes. The nucleic acid molecules are further useful for significant genes or quantity of a protein or mRNA and for detecting the presence or quantity of a protein by tissue printing. The present sequence represents a specifically claimed EST isolated from a cotton variety Nucotroning part of a protein by tissue printing sequence data for this patent did not form part of the printed sequence data for this patent did not form part of formed protein the useful for specification, but was obtained in electronic former form The invention relates to 17880 cotton expressed sequence tags (ESTS; ACN45220-ACN63099). The ESTS were isolated from cDNA libraries generated from primed or non-primed seeds from variety DESOB, mature seeds from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoccium tissue, developing fibres, carpel walls and septa from variety Nucotton33B. The invention also relates to substantially purified proteins or their fragments encoded by nucleic acid molecules of the invention, and to transformed plants having a nucleic acid construct comprising a nucleic acid of the invention. The cotton ESTS are useful as specification, but was obtained in electronic format directly from th patent office at seqdata.uspto.gov/sequence.html?DocID=US20040123340

                                              \mathbf{n}
                                                                                                                                                                                                                                                                              407 GluLeuGluLysGlnLeuGluLysGlnArgGluLeuGluArgGlnArgGluGluGluArg 426
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymetides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                              Human; cytokine; cell proliferation; cell differentiation; gene therapy;
cotton variety Nucotton33B gynoecium tissue cDNA library (LIB3829). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from the U patent office at segdata.uspto.gov/sequence.html?bocID=US20040123340
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       vaccine; peptide therapy; stem cell growth factor; haematopolesis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to 17880 cotton expressed sequence tags (ESTs; ACM 92209). The ESTs were isolated from CDNA libraries generated from primed or non-primed seeds from variety DP508, mature seeds from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septer from variety Nucotton318. The invention also relates to substantially purified proteins or their fragments encoded by nucleic acid molecules of the
                                                                                                                                                                                                                                                                                             Cotton; plant; EST; expressed sequence tag; transgenic plant; gynoecium; variety Nucotton33B; library LIB3829; molecular tag; molecular marker; genetic mapping; molecular mapping; seed germination; plant growth; plant quality; plant yield; plant breeding; tissue printing; ss.
treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention describes a nucleic acid construct. The nucleic acid construct comprises: (a) a first polynucleotide segment including at least one nucleic acid sequence element; and (b) a second polynucleotide segment encoding a polypeptide including a nucleic acid binding domain being capable of specifically binding the above nucleic acid sequence element, and a localisation signal for directing transport of the polypeptide into a DNA containing organelle such that when the nucleic acid construct is introduced into a cell, expression of the polypeptide from the second polynucleotide segment directs transport of the nucleic acid construct into the DNA containing organelle. The nucleic acid construct is useful in high efficiency delivery of polynucleotides into DNA containing organelles such as nucleus, chloroplast or mitochondria, and containing organelles such as nucleus, chloroplast or mitochondria, and approaches designed for therapeutic purposes. The nucleic acid construct may also be used to isolate novel genes encoding nucleic acid sequence. ig proteins. The present sequence represents a peptide nucleic acid recognition sequence, which is used in an example from the present invention binding

                                                                                 ACN59315,
```

The invention relates to 17880 cotton expressed sequence tags (ESTB;
ACM45220-ACN63099). The ESTB were isolated from cDNA libraries generated
CC ACM45220-ACN63099). The ESTB were isolated from cDNA libraries generated
CC from prined seeds from variety DPSOB, mature seeds from
variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
curiety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
curiety Coker 312 Boswell 96 Field, and septa from variety
CC Nucotton3B. The invention also relates to substantially purified
cromprising a nucleic acid of the invention. The cotton ESTB are useful as
molecular tags to isolate genetic regions, to isolate genes, to map
C genes, to determine gene function and to determining whether genes
C genes, to determine gene family. The nucleic acid molecules may be
used for isolating a variety of agronomically significant genes
c used for isolating a variety of agronomically significant genes
c associated with plant growth, quality, yield, and could also serve as
links in metabolic and catabolic pathways. The nucleic acid molecules are
also useful for identifying genes important in initiating and maintaining
seed germination or that may be used to miligate stresses encountered
during seed germination. The ESTB additionally enable the acquisition of
compress and catabolic acid molecular markers useful in breeding
conformically significant genes in these tissues and/or other tissues,
adronomically significant genes in these tissues are further useful for
schemes, genetic and molecular mapping, and in cloning of agronomically
significant genes or quantity of a protein or mRNA and for
detecting the expression level or pattern of a protein or mRNA and for
detecting the presence or quantity of a protein or mRNA and for

Gossypium hirsutum.

New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular tags to map genes.

Claim 1; SEQ ID NO 15706; 34pp; English

The invention relates to 17880 cotton expressed sequence tags (ESTs; ACN45220-ACN63099). The ESTs were isolated from cDNA libraries generated from parimed over an order to the ESTs were isolated from cDNA libraries generated from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septe from variety isolated. The invention also relates to substantially purified proteins or their fragments encoded by nucleic acid molecules of the invention, and to transformed plants having a nucleic acid construct comprising a nucleic acid of the invention. The cotton ESTs are useful as molecular tags to isolate genetic regions, to isolate genes to mapped genes, to determine gene function and to determining whether genes are useful for isolating a variety of agronomically significant genes are useful for isolating a variety of agronomically significant genes as associated with plant growth, quality, yield, and could also serve as links in metabolic and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to mitigate stresses encountered during seed germination. The ESTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically capened and indicated genetic and molecular mapping, and in cloning of agronomically detecting the expression level or pattern of a protein or man and expression level or pattern of a protein or man and expression level or pattern of a protein or man and expression level or pattern of a protein or man and expression level or pattern of a protein or man and expression level or pattern of a protein or man and expression level or pattern of a protein or man and expression level or pattern of a protein or man and expression level or pattern of a prote specification, but was obtained in electronic format directly from the US patent office at segdata.uspto.gov/sequence.html?DocID=US20040123340 cotton variety Nucotton33B gynoecium tissue cDNA library (LIB3829). New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular tags to map genes.

Claim 1; SEQ ID NO 14335; 34pp; English.

The invention relates to 17880 cotton expressed sequence tags (ESTB;
ACN45220-ACN63099). The ESTB were isolated from cDNA libraries generated
ACN45220-ACN63099). The ESTB were isolated from cDNA libraries generated
CC from primed seeds from variety DPSOB, mature seeds from
variety Coker 312 Boswell 96 Field, and and rectum tissue, gynoecium
tissue, developing fibres, carpel walls and septa from variety
CC Mucotton33B. The invention also relates to substantially purified
proteins or their fragments encoded by nucleic acid molecules of the
invention, and to transformed plants having a nucleic acid construct
comprising a nucleic acid of the invention. The cotton ESTB are useful as
molecular tags to isolate genetic regions, to isolate genes, to determine gene function and to determining whether genes are
cc members of a particular gene family. The nucleic acid molecules may be
genes, to determine gene family. The nucleic acid molecules may be
used for isolating a variety of agronomically significant genes
cs associated with plant growth, quality, yield, and could also serve as
links in metabolic and catabolic pathways. The nucleic acid molecules are
also useful for identifying genes important in initiating and maintaining
seed germination or that may be used to mitigate stresses encountered
during seed germination. The ESTB additionally enable the acquisition of
promoters and cis-regulatory elements which will be useful to express
cd agronomically significant genes in these tissues and/or other tissues,
and also permits the acquisition of molecular markers useful in breeding
schemes, genetic and molecular mapping, and in cloning of agronomically
cdetecting the expression level or pattern of a protein or mRNA and for
detecting the presence or quantity of a protein or mRNA and for
checking the wardersole as specifically claimed Bones.
COTTON variety and molecular results and protein or mRNA and correction variety. the US cotton variety Nucottonil gynoecium tissue cDNA library (LIB3829). New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular tags to map genes.

Claim 1; SEQ ID NO 808; 34pp; English.

The invention relates to 17880 cotton expressed sequence tags (ESTs; ACN45220-ACN63099). The ESTs were isolated from cDNA libraries generated from primed or non-primed seeds from variety Debols, mature seeds from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septa from variety Nucotton338. The invention also relates to substantially purified proteins or their fragments encoded by nucleic acid molecules of the invention, and to transformed plants having a nucleic acid construct comprising a nucleic acid of the invention. The cotton ESTs are useful as molecular tags to isolate genetic regions, to isolate genes, to map genes, to determine gene function and to determining whether genes are members of a particular gene family. The nucleic acid molecules may be

```
used for isolating a variety of agronomically significant genes
associated with plant growth, quality, yield, and could also serve as
links in metabolic and catabolic pathways. The nucleic acid molecules
also useful for identifying genes important in initiating and maintaining
seed germination or that may be used to mitigate stresses encountered
during seed germination. The BSTs additionally enable the acquisition of
promoters and cis-regulatory elements which will be useful to express
agronomically significant genes in these tissues and/or other tissues,
and also permits the acquisition of molecular markers useful in breeding
schemes, genetic and molecular mapping, and in cloning of agronomically
significant genes. The nucleic acid molecules are further useful for
detecting the expression level or pattern of a protein or mRNA and for
detecting the presence or quantity of a protein by tissue printing. The
present sequence represents a specifically claimed BST isolated from a
cotton variety bps08 primed seed cDNA library (LIB3825). The sequence
data for this patent did not form part of the printed specification, but
was obtained in electronic format directly from the US patent office at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          seqdata.uspto.gov/sequence.html?DocID=US20040123340

New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular tags to map genes.

Claim 1; SEQ ID NO 14266; 34pp; English.

The invention relates to 17880 cotton expressed sequence tags (ESTS;

ACN45220-ACN63099). The ESTS were isolated from cDNA libraries generated
from primed or non-primed seeds from variety DP50B, mature seeds from
variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
tissue, developing fibres, carpel walls and septa from variety

Nucotton33B. The invention also relates to substantially purified
comprising a nucleic acid of the invention. The cotton ESTS are useful as
invention, and to transformed plants having a nucleic acid construct
comprising a nucleic acid of the invention. The cotton ESTS are useful as
combecular tags to isolate genetic regions, to isolate genes to members of a particular gene function and to determining whether genes are
comparising a variety of agronomically significant genes are
members of a particular gene family. The nucleic acid molecules may be
compared with plant growth, quality, yield, and could also serve as
links in metabolic and catabolic pathways. The nucleic acid molecules are
also useful for identifying genes important in initiating and maintaining
seed germination or that may be used to mitigate stresses encountered
during seed germination. The ESTs additionally enable the acquisition of
promoters and cis-regulatory elements which will be useful to express
comparison genes; the acquisition of molecular markers useful in breeding
schemes, genetic and molecular mapping, and in cloning of agronomically
significant genes in these tissues are further useful for
detecting the expression level or pattern of a protein or mRNA and for
detecting the presence or quantity of a protein by tissue printing. The
correct or variety whorternally canned in the presence as geoedically clanded a protein or mRNA in practice.

Control to the presence or quantity of a protein by tissue printing. The cotton variety Nucotton33B gynoecium tissue cDNA library (LIB3829). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at seqdata.uspto.gov/sequence.html?DocID=US20040123340

```
number of oligonucleotides derived from an orthologue gene of a different organism or species immobilised on a support body. The oligonucleotide array has two sides comprising a gene derived from two different corganisms, in which one side comprises a human gene. In the oligonucleotide array a base sequence differs in a different position on the support body. Each of the oligonucleotides is a partial sequence of the organism and organisms B. The sequence match degree of the organism species A and the organism species B is less than the organism species A and the organism species B is the level-of. The sequence handless and the organism species B is the level-of. The squares species A and the organism species B is the level-of. The cyanism species A and the organism species B is the level-of. The cyanism species A and the organism species B is the level-of. The organism species A and the organism species B is the level-of. The cyanism species A and the organism species C or more. The found value or the calculated value of the malting-temperature of the variant genes other than the orthologue gene of the cyanism species B is 20 degrees C or more. The oligonucleotide array is useful for measuring expression distribution of the orthologue gene in different organisms. The method is useful for comparing expression change of the orthologue gene in different organisms. The method is useful for medical agent administration and for comparing change of the function of the orthologue gene in different organisms. The oligonucleotide array has the orthologue gene in different organisms. The oligonucleotide array is two or more types of organism simultaneously. The oligonucleotide array is two or more types of organism simultaneously. The oligonucleotide array is in the oligonucleotide array of the invention.

(COMP-) COMPUGEN INC.

Faigler S; Mintz L, Mintz E, Wasserman A, Shoshan A,

WPI; 2002-257383/30.

New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of genome, useful for detecting tissue-, pathology-, and developmentalspecific genes.

Example 1; SEQ ID NO 10766; 47pp; English.

\$XXCCCCCCCCCCCCCCCCCX

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcribtome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribtion unit of the genome, which encodes one or more messenger RNA splice variants. The coligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries and splice variants of human or animal cranscriptomes. The libraries may also be used as specialised minicatoriptomes. The libraries may also be used as specialised minicatoriptomes. The libraries may also be used as specialised minicatoriptomes. The libraries of a sub-transcriptome under a particular biological cranscriptes of a sub-transcriptome under a particular condition; to detect or appecific genes such as those genes only expressed in specific pathological condition; to detect or variants of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from a particular invariant of a transcriptome of a patient suffering from a particular for area, hunds are used in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                 6269

XhoI; cDNA library from Arabidopsis thaTiana, accession
C24; seedling; Lambda ZAPII phage library was made at the
Max-Planck-Institute of Molecular Plant Physiology, Golm,
Germany and mass-excised at the Max-Planck-Institute for
Plant Breeding Research, Cologne, Germany; cloning sites
BCORI-XhoI; Note: Sequencing granted in the context of the
GABI Arabidopsis Verbund I: Genetic Diversity,
'Establishment of high-efficiency SNP-based mapping tools
and development of methods for genome-wide mutation
detection' PI: Bernd Weisshaar Sequence submission managed
by RZPD/GABI-Primary database: http://gabi.rzpd.de This
clone is available from RZPD; contact RZPD (clone@rzpd.de)
Mitchell-Olds, T. and Weisshaar, B.
Large-scale identification and analysis of genome-wide
single-nucleotide polymorphisms for mapping in Arabidopsis thaliana
Genome Res. 13 (6), 1250-1257 (2003)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              96 bp mRNA linear EST 15-JUL-2002

/note="Vector: pBluescript SK-; Site 1: EcoRI; Site 2:
XhoI; supplier: Petunia x hybrida cv. Mitchell Diploid
plants were grown from seeds to a fully flowering stage
under standard greenhouse conditions. Ten entire flowers
of six developmental stages were collected on the same day
from plants grown in standard greenhouse. The flower
stages were as follows in chronological order from
youngest to oldest: stage 1 - no color in corolla;
orolla .75-1 inches long) stage 3 - fully elongated
corolla (not open); corolla 1.5 inches long stage 4 -
fully open corolla; anthers not yet dehisced stage 5 -
fully open corolla; anthers not yet dehisced stage 5 -
fully open corolla; freshly anthesed, bright yellow
pollen; wet stigma stage 6 - pre-senescent; yellowing of
corolla tube; dry brown pollen (if present); stigma dry.
Total RNA was extracted from each sample was combined for subsequent poly
A+ mRNA selection and cDNA synthesis."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
